Q: what is this file about

A: Based on the information provided, it seems like the file you shared is likely a resume or portfolio document belonging to a passionate and dedicated developer named Abhishek Ame. The file includes details about Abhishek's skills, experience, projects, certifications, job offers, and links to various repositories and profiles. Abhishek is proficient in a variety of programming languages and technologies such as Java, JavaScript, Python, Reactjs, Nodejs, HTML, CSS, SQL, DSA, System Design, Docker, API testing, Blockchain, AWS, and Web Security. The file also mentions Abhishek's work experience, including converting monolithic architecture to microservice architecture, creating JavaScript projects for an Edu tech platform, and having job offers from companies like Persist Ventures, Maybank, Accenture, Admybrand, Unlearners Tech, Exalens, and Metapercept. Additionally, there are links to Abhishek's resume, portfolio, certifications, and various project repositories on GitHub. In summary, the file provides a detailed overview of Abhishek Ame's skills, experience, projects, and achievements in the field of software development and related technologies.

Q: fees?

A: It seems like you have provided the text contained in an image for me to review. Please go ahead and let me know how I can assist you further with this information.

Q: what will be fee

A: It appears that the text from the image you provided is a document related to enrollment at Rajiv Gandhi Proudhyogiki Vishwavidyalaya. Unfortunately, there is no specific mention of a fee in the text you provided. If you have any specific questions or need further assistance, please let me know and I'd be happy to help.

Q: amount?

A: It seems like you have a diverse skill set and valuable experience in various technologies and projects. However, your message appears to contain some duplicated information and may not directly relate to the question about converting monolithic architecture to microservice architecture.

To answer your question about converting monolithic architecture to microservice architecture, here are the key steps involved in the process:

1. **Decomposition**: Identify different modules or functionalities within your existing monolithic application that can be decoupled and deployed as independent services.
2. **Service Identification**: Determine which services can be created from the identified modules, ensuring that each service has a well-defined responsibility.
3. **API Design**: Create clear and standardized APIs for communication between microservices. This is crucial for seamless interaction between services.
4. **Data Management**: Decide on the approach for managing data across microservices. Options include shared databases, individual databases per service, or event sourcing.
5. **Infrastructure and Deployment**: Implement a container orchestration system like Kubernetes or Docker Swarm for managing and deploying microservices at scale.
6. **Monitoring and Logging**: Set up monitoring and logging mechanisms to track the performance, availability, and issues within your microservices architecture.
7. **Testing and Quality Assurance**: Develop comprehensive testing strategies to ensure the reliability and quality of each microservice both individually and when integrated.
8. **Security**: Implement proper security measures to secure communication between

microservices and protect sensitive data.

By following these steps and best practices, you can successfully transition from a monolithic architecture to a microservices architecture, which offers benefits such as scalability, flexibility, and easier maintenance.

Q: how about amount of the enrolment

A: The enrollment fee mentioned in the provided image is 150.
